

MEGATREND ANALYSIS

AI becomes the operating system of the enterprise

Accelerating · Evidence current to 27 August 2026

The signal

The briefs move from experimentation and workforce acceptance to workflow redesign, agents, AI economics, and enterprise-wide value delivery.

30% of surveyed organizations had integrated agents into workflows in 2026, more than double the prior-year share. ^[1]	3x / 1.6x / 2.7x AI leaders' reported advantages in cost reduction, EBIT margin and return on invested capital versus peers. ^[2]	6% of surveyed companies had trained at least one-quarter of their workforce on GenAI at the start of 2024. ^[3]

What is changing - and why it matters

Across the archive, AI moves through three stages: access to generative tools, redesign of individual tasks, and finally redesign of end-to-end workflows and business economics. The decisive shift is the third. Agents, proprietary data, governance, infrastructure and human roles begin to operate as one system rather than as separate technology projects. External research reinforces the direction but also shows that value is concentrating among firms with scale, differentiated data, physical assets or the ability to rewire work. The practical question is therefore not whether a company has AI, but where AI changes a complete decision or value flow.

Executive implication

Competitive advantage shifts from model access to redesigning how work, decisions, and capital flow.

Action agenda

- Select three to five end-to-end workflows where revenue, cost, speed or risk can be measured together.
- Give one business executive ownership of each workflow, including data, adoption, controls and P&L impact.
- Track total human-plus-machine economics, not model cost or token consumption in isolation.

What could change the view

- Unit economics fail to improve after adoption costs, review effort and infrastructure are included.
- AI value remains concentrated in isolated tasks while core decision rights and processes stay unchanged.
